Pavement Maintenance Contractors

FLEX-PATCH

What is Flex-Patch?

Flex-Patch is a highly innovative maintenance process using a blend of quality modified asphalt sealant and fibers. The unique characteristics of the sealant helps reduce bleeding during hot weather and greatly improves low temperature flexibility. An aggregate cover material is applied for the added benefit of improving the ride of the road.

Flex-Patch Benefits & Uses

- ◆ Repairs cupped joints, alligator and compound cracking
- ◆ Provides remarkable improvement to the ride of the road
- ◆ Can be used on asphalt and concrete pavements
- ◆ Excellent process for prepping roads before surface treatment applications

Our Process

Step 1

Fahrner crews clean and dry the area using air compressors with a minimum of 100 psi and heat lances with a minimum temperature of 2200 degrees. Sealant will not adhere to dirty or wet surfaces.

Step 2

FLEX-PATCH is applied through a wand and then hand squeegeed to insure proper coverage. A sufficient amount of sealant is applied to flood the entire distressed area and provide an 1/8" base to hold the final cover material.

Step 3

A fine aggregate cover material is applied over the sealant. The cover material has the added benefit of improving the ride of the surface.
